BACKGROUND OF THE INVENTION

This invention relates to methods of treating cyclooxygenase mediated diseases and certain pharmaceutical compositions therefor.

Non-steroidal, antiinflammatory drugs exert most of their antiinflammatory, analgesic and antipyretic activity and inhibit hormone-15 induced uterine contractions and certain types of cancer growth through inhibition of prostaglandin G/H synthase, also known as cyclooxygenase. Initially, only one form of cyclooxygenase was known, this corresponding to cyclooxygenase-1 (COX-1) or the constitutive enzyme, as originally identified in bovine seminal vesicles. More recently the 20 gene for a second inducible form of cyclooxygenase, cyclooxygenase-2 (COX-2) has been cloned, sequenced and characterized initially from chicken, murine and human sources. This enzyme is distinct from the COX-1 which has been cloned, sequenced and characterized from various sources including the sheep, the mouse and man. The second form of 25 cyclooxygenase, COX-2, is rapidly and readily inducible by a number of agents including mitogens, endotoxin, hormones, cytokines and growth factors. As prostaglandins have both physiological and pathological roles, we have concluded that the constitutive enzyme, COX-1, is responsible, in large part, for endogenous basal release of prostaglandins 30 and hence is important in their physiological functions such as the maintenance of gastrointestinal integrity and renal blood flow. In

contrast, we have concluded that the inducible form, COX-2, is mainly responsible for the pathological effects of prostaglandins where rapid

induction of the enzyme would occur in response to such agents as inflammatory agents, hormones, growth factors, and cytokines. Thus, a selective inhibitor of COX-2 will have similar antiinflammatory, antipyretic and analgesic properties to a conventional non-steroidal antiinflammatory drug, and in addition would inhibit hormone-induced uterine contractions and have potential anti-cancer effects, but will have a diminished ability to induce some of the mechanism-based side effects. In particular, such a compound should have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and possibly a lessened ability to induce asthma attacks in aspirin-sensitive asthmatic subjects.

Furthermore, such a compound will also inhibit prostanoidinduced smooth muscle contraction by preventing the synthesis of
contractile prostanoids and hence may be of use in the treatment of
dysmenorrhea, premature labour, asthma and eosinophil related disorders.
It will also be of use in the treatment of Alzheimer's disease, for
decreasing bone loss particularly in postmenopausal women (i.e.
treatment of osteoporosis) and for the treatment of glaucoma.

A brief description of the potential utility of cyclooxygenase-2 inhibitors is given in an article by John Vane, Nature, Vol. 367, pp. 215-216, 1994, and in an article in Drug News and Perspectives, Vol. 7, pp. 501-512, 1994.

SUMMARY OF THE INVENTION

I as well as a method of treating cyclooxygenase-2 mediated diseases comprising administration to a patient in need of such treatment of a non-toxic therapeutically effective amount of a compound of Formula I.

Some of the compounds described herein contain one or more asymmetric centers and may thus give rise to diastereomers and optical isomers. The present invention is meant to comprehend such possible diastereomers as well as their racemic and resolved, enantiomerically pure forms and pharmaceutically acceptable salts thereof.

Some of the compounds described herein contain olefinic double bonds, and unless specified otherwise, are meant to include both E and Z geometric isomers.

In a second embodiment, the invention encompasses pharmaceutical compositions for inhibiting cyclooxygenase and for treating cyclooxygenase mediated diseases as disclosed herein comprising a pharmaceutically acceptable carrier and a non-toxic therapeutically effective amount of compound of formula I as described above.

Within this embodiment the invention encompasses pharmaceutical compositions for inhibiting cyclooxygenase-2 and for treating cyclooxygenase-2 mediated diseases as disclosed herein comprising a pharmaceutically acceptable carrier and a non-toxic therapeutically effective amount of compound of formula I as described above.

In a third embodiment, the invention encompasses a method of inhibiting cyclooxygenase and treating cyclooxygenase mediated diseases, advantageously treated by an active agent that selectively inhibits COX-2 in preference to COX-1 as disclosed herein comprising: administration to a patient in need of such treatment of a non-toxic therapeutically effective amount of a compound of Formula I as disclosed herein.

- 41 -

The pharmaceutical compositions of the present invention comprise a compound of Formula I as an active ingredient or a pharmaceutically acceptable salt, thereof, and may also contain a pharmaceutically acceptable carrier and optionally other therapeutic ingredients. The term "pharmaceutically acceptable salts" refers to salts 5 prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic salts, manganous, potassium, sodium, zinc, and the like. Particularly preferred are the ammonium, calcium, magnesium, 10 potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, such as arginine, betaine, caffeine, choline, N,N-dibenzylethylenediamine, diethylamine, 2-15 diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, 20 tripropylamine, tromethamine, and the like, and basic ion exchange resins.

It will be understood that in the discussion of methods of treatment which follows, references to the compounds of Formula I are meant to also include the pharmaceutically acceptable salts.

25

30

The compound of Formula I is useful for the relief of pain, fever and inflammation of a variety of conditions including rheumatic fever, symptoms associated with influenza or other viral infections, common cold, low back and neck pain, dysmenorrhea, headache, toothache, sprains and strains, myositis, neuralgia, synovitis, arthritis, including rheumatoid arthritis, degenerative joint diseases (osteoarthritis), gout and ankylosing spondylitis, bursitis, burns, injuries, following surgical and dental procedures. In addition, such a compound may inhibit cellular neoplastic transformations and metastic tumor growth and hence

10

15

20

25

30

can be used in the treatment of cancer. Compound I may also be of use in the treatment and/or prevention of cyclooxygenase-mediated proliferative disorders such as may occur in diabetic retinopathy and tumour angiogenesis.

Compound I will also inhibit prostanoid-induced smooth muscle contraction by preventing the synthesis of contractile prostanoids and hence may be of use in the treatment of dysmenorrhea, premature labor, asthma and eosinophil related disorders. It will also be of use in the treatment of Alzheimer's disease, and for the prevention of bone loss (treatment of osteoporosis) and for the treatment of glaucoma.

By virtue of its high cyclooxygenase-2 (COX-2) activity and/or its specificity for cyclooxygenase-2 over cyclooxygenase-1 (COX-1), Compound I will prove useful as an alternative to conventional non-steroidal antiinflammatory drugs (NSAID'S) particularly where such non-steroidal antiinflammatory drugs may be contra-indicated such as in patients with peptic ulcers, gastritis, regional enteritis, ulcerative colitis, diverticulitis or with a recurrent history of gastrointestinal lesions; GI bleeding, coagulation disorders including anemia such as hypoprothrombinemia, haemophilia or other bleeding problems; kidney disease; those prior to surgery or taking anticoagulants.

Similarly, Compound I, will be useful as a partial or complete substitute for conventional NSAID'S in preparations wherein they are presently co-administered with other agents or ingredients. Thus in further aspects, the invention encompasses pharmaceutical compositions for treating cyclooxygenase-2 mediated diseases as defined above comprising a non-toxic therapeutically effective amount of the compound of Formula I as defined above and one or more ingredients such as another pain reliever including acetominophen or phenacetin; a potentiator including caffeine; an H2-antagonist, aluminum or magnesium hydroxide, simethicone, a decongestant including phenylephrine, phenylpropanolamine, pseudophedrine, oxymetazoline, ephinephrine, naphazoline, xylometazoline, propylhexedrine, or levodesoxyephedrine; an antiitussive including codeine, hydrocodone, caramiphen, carbetapentane, or dextramethorphan; a prostaglandin

including misoprostol, enprostil, rioprostil, ornoprostol or rosaprostol; a diuretic; a sedating or non-sedating antihistamine. In addition the invention encompasses a method of treating cyclooxygenase mediated diseases comprising: administration to a patient in need of such treatment a non-toxic therapeutically effective amount of the compound of Formula I, optionally co-administered with one or more of such ingredients as listed immediately above.

For the treatment of any of these cyclooxygenase mediated diseases Compound I may be administered orally, topically, parenterally, by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques. In addition to the treatment of warm-blooded animals such as mice, rats, horses, cattle sheep, dogs, cats, etc., the compound of the invention is effective in the treatment of humans.

As indicated above, pharmaceutical compositions for treating cyclooxygenase-2 mediated diseases as defined may optionally include one or more ingredients as listed above.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn

- 44 -

starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredients is mixed with water or miscible solvents such as propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethycellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose, saccharin or aspartame.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example, arachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example, beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for example, liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example, soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example, polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for example, glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents. The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-

- 46 -

acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compound I may also be administered in the form of a suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, creams, ointments, gels, solutions or suspensions, etc., containing the compound of Formula I are employed. (For purposes of this application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised of a pharmaceutical carrier, cosolvent, emulsifier, penetration enhancer, preservative system, and emollient.

Dosage levels of the order of from about 0.01 mg to about 140 mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5 mg to about 7 g per patient per day. For example, inflammation may be effectively treated by the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from 0.5 mg to 5 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Dosage unit

forms will generally contain between from about 1 mg to about 500 mg of an active ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

The compounds of the present invention can be prepared according to the following methods

Method A

5

An appropriately substituted acid halide is reacted with thioanisole in a solvent such as chloroform in the presence of a Lewis acid such as aluminum chloride to afford a ketone which is then hydroxylated with base such as aqueous sodium hydroxide in a solvent such as carbon tetrachloride with a phase transfer agent such as Aliquat 336. Then treatment with an oxidizing agent such as MMPP in solvents such as CH2Cl2/MeOH, affords an sulfone which is reacted with an appropriately substituted acetic acid in a solvent such as CH2Cl2 in the presence of an esterifying agent such as CMC and DMAP and then treated with DBU to afford lactone Ia.

- 48 -

Method B

An appropriately substituted hydroxyketone is acylated withn appropriately substituted acid halide in a solvent such as dichloromethane in the presence of a base such as pyridine. The ester obtained is then reacted with an appropriately substituted nucleophile R²XH in a solvent such as DMF and with a base such as sodium hydride, then treatment with DBU in a solvent such as acetonitrile affords lactone Ia.

Method C

Method G

5

10

15

An appropriately substituted hydroxyketone is acylated with acetyl bromide or chloride in a solvent such as dichloromethane with a base such as DBU and DMAP. Further treatment with a base such as sodium hydride in a solvent such as DMF effects cyclization to afford the 5-membered lactone. Treatment of this lactone with a base such as LDA and an appropriately substituted acid halide in a solvent such as THF. followed by oxidation with a reagent such as MMPP in solvent such as CH2Cl2/MeOH and hydrolysis by a base such as NaOH in a solvent such as MeOH/THF gives an alcohol Ib which is then oxidized to lactone Ic by a reagent such as Jone's reagent in a solvent such as acetone(the initially formed ketone is reduced in the reaction and acylated, thus requiring hydrolysis and re-oxidation to obtain ketone Ic). Alternatively, alcohol Ib can be obtained by using an aldehyde R²CHO as the electrophile instead of an acid halide.

Method H

5

10

An appropriately substituted methyl sulfide is oxidized to the sulfoxide with a reagent such as MMPP in solvents such as dichloromethane and methanol followed by treatment with trifluoroacetic anhydride, then aqueous sodium hydroxide. Further treatment by Cl₂ in aqueous acetic acid followed by treatment by an amine affords an intermediate sulfonamide. This sulfonamide is then esterified with an appropriately substituted acid in the presence of a reagent such as CMC and further treatment with a base such as DBU affords the lactone. In the case where the amine group is protected by an acid labile group treatment with an acid such as trifluoroacetic acid in a solvent such as dichloromethane affords compound Ia.

10

Method I

An appropriately substituted bromoketone is reacted with an appropriately substituted acid in a solvent such as acetonitrile and with a base such as Et3N. Treatment with DBUand then O2 gives a hydroxy compound Id. Etherification of this hydroxy with an alcohol in a solvent such as THF and with an acid such HCl gives Ie. By oxidation of the sulfide into a sulfone by a reagent such as m-CPBA and then displacement of this sulfone by an appropriately substituted nucleophile compound If is obtained.

Method J

An appropriately substituted nucleophile is reacted with an appropriately substituted haloacetate in a solvent such as acetonitrile with a base such as DBU to afford compound Ia.

Method K

An appropriately substituted vinyl ketone is coupled with an appropriately substituted benzaldehyde with a catalyst such as 3-benzyl-5-(2-hydroxyethyl)-4-methylthiazolium chloride in the presence of a base such as triethylamine in a solvent such as 1,4-dioxane to form a diketone. The diketone is cyclized in a solvent such as methanol with a base such as DBU to the final product Ig. When R 1=SO2Me, the starting material can also be a p-methylthiobenzaldehyde, with the methylthio group being oxidized to SO2Me using MMPP, mCPBA or OXONE® in the last step.

An appropriately substituted halide is reacted with a base such as DBU in a solvent such as acetonitrile to afford an epoxide which is then reacted with an appropriately substituted nucleophile in solvents such as DMF and a base to afford lactone Ia.

Method M

An appropriately substituted acid halide is reacted with an appropriately substituted hydroxyketone in the presence of a base such as pyridine in a solvent such as acetonitrile, further treatment with a base such as DBU gives an hydroxylactone. The hydroxylactone is reacted with an appropriately substituted halide in a solvent such as benzene with a reagent such as Ag₂CO₃ to afford the lactone Ih.

Method N

An appropriately substituted hydroxyketone is reacted with an appropriately substituted carboxylic acid with an esterifying agent such as CMC in the presence of DMAP in a solvent such CH2Cl2, followed by treatment with a base such as DBU to afford a lactone ester. This lactone ester is then reacted with a reagent such as the one formed with piperidine and trimethylaluminium to afford the lactone Ic.

An appropriately substituted nucleophile such as pentan-3-ol is treated with a base such as sodium hydride in a solvent such as benzene and then reacted with an electrophile such as sodium chloroacetate to afford an acid. This acid is then reacted with an appropriately substituted hydroxyketone with an esterifying reagent such as CMC in a solvent such as dichloromethane to give an ester which is cyclized upon treatment with a base such as sodium hydride in a solvent such as DMF to afford lactone Ia.

Method P

An appropriately substituted nucleophile is reacted with an appropriately substituted haloacetate alkaline salt (such as sodium) in a solvent such as benzene and with a reagent such as Ag2CO3 to give an ester which is then hydrolyzed with a reagent such as NaOH in solvents such as water and methanol to give an acid. The acid is then esterified with an appropriately substituted hydroxyketone with reagents such as CMC and DMAP in a solvent such as dichloromethane to give an ester which is then cyclized with a base such as DBU in a solvent such as CH3CN to afford a lactone. The sulfide is then oxidized with a reagent such as MMPP in solvents such as CH2Cl2, MeOH and water to afford lactone Ia.

An appropriately substituted halo acetate is reacted with an appropriate secondary amine (R²(R¹⁵)NH) in a solvent such as CH₃CN; further treatment with a base such as NaH in a solvent such as DMF affords lactone Ia.

Method X

An appropriately substituted lactone (*Tetrahedron*, 1984, 40, 1313) is treated with a base such as LDA and reacted with 2,2,2-trifluoroiodoethane. Further treatment with the lithium salt of 4-bromothioanisole gives the desired hemiketal, which is then reacted as in method R to give the desired lactone Im.

Assays for determining Biological Activity

The compound of Formula I can be tested using the 5 following assays to determine their cyclooxygenase-2 inhibiting activity.

INHIBITION OF CYCLOOXYGENASE ACTIVITY

Compounds are tested as inhibitors of cyclooxygenase 10 activity in whole cell cyclooxygenase assays. Both of these assays measure prostaglandin E2 synthesis in response to arachidonic acid, using a radioimmunoassay. Cells used for these assays are human osteosarcoma 143 cells (which specifically express COX-2) and human U-937 cells (which specifically express COX-1). In these assays, 100% 15 activity is defined as the difference between prostaglandin E2 synthesis in the absence and presence of arachidonate.

Whole Cell Assays

For cyclooxygenase assays, osteosarcoma cells are cultured 20 in 1 mL of media in 24-well multidishes (Nunclon) until confluent (1-2 x 10⁵ cells/well). U-937 cells are grown in spinner flasks and resuspended to a final density of 1.5 x 106 cells/mL in 24-well multidishes (Nunclon). Following washing and resuspension of osteosarcoma and U-937 cells in 1 mL of HBSS, 1 µL of a DMSO solution of test compound or DMSO

25 vehicle is added, and samples gently mixed. All assays are performed in triplicate. Samples are then incubated for 5 or 15 minutes at 37°C, prior to the addition of arachidonic acid. Arachidonic acid (peroxide-free, Cayman Chemical) is prepared as a 10 mM stock solution in ethanol and further diluted 10-fold in HBSS. An aliquot of 10 μ L of this diluted solution is added to the cells to give a final arachidonic acid concentration of 10 μ M. Control samples are incubated with ethanol vehicle instead of arachidonic acid. Samples are again gently mixed and incubated for a further 10 min. at 37°C. For osteosarcoma cells, reactions are then stopped by the addition of 100 μ L of 1N HCl, with mixing and by the rapid removal of the solution from cell monolayers. For U-937 cells, reactions are stopped by the addition of 100 μ L of 1N HCl, with mixing. Samples are then neutralized by the addition of 100 μ L of 1N NaOH and PGE2 levels measured by radioimmunoassay.

15 Whole cell assays for COX-2 and COX-1 using CHO transfected cell lines

10

Chinese hamster ovary (CHO) cell lines which have been stably transfected with an eukaryotic expression vector pCDNAIII containing either the human COX-1 or COX-2 cDNA's are used for the 20 assay. These cell lines are referred to as CHO [hCOX-1] and CHO [hCOX-2], respectively. For cyclooxygenase assays, CHO[hCOX-1] cells from suspension cultures and CHO[hCOX-2] cells prepared by trypsinization of adherent cultures are harvested by centrifugation (300 x g, 10 min) and washed once in HBSS containing 15 mM HEPES, pH 7.4, 25 and resuspended in HBSS, 15 mM HEPES, pH 7.4, at a cell concentration of 1.5 x 106 cells/ml. Drugs to be tested are dissolved in DMSO to 66.7fold the highest test drug concentration. Compounds are typically tested at 8 concentrations in duplicate using serial 3-fold serial dilutions in DMSO of the highest drug concentration. Cells (0.3 x 106 cells in 200 30 μl) are preincubated with 3 μl of the test drug or DMSO vehicle for 15 min at 37°C. Working solutions of peroxide-free AA (5.5 μM and 110 μM AA for the CHO [hCOX-1] and CHO [COX-2] assays, respectively) are prepared by a 10-fold dilution of a concentrated AA solution in

- 125 -

ethanol into HBSS containing 15 mM HEPES, pH 7.4. Cells are then challenged in the presence or absence of drug with the AA/HBSS solution to yield a final concentration of 0.5 µM AA in the CHO[hCOX-1] assay and a final concentration of 10 µM AA in the CHO[hCOX-2] 5 assay. The reaction is terminated by the addition of 10 ul 1 N HCl followed by neutralization with 20 µl of 0.5 N NaOH. The samples are centrifuged at 300 x g at 4°C for 10 min, and an aliquot of the clarified supernatant is appropriately diluted for the determination of PGE2 levels using an enzyme-linked immunoassay for PGE2 (Correlate PGE2 enzyme immunoassay kit, Assay Designs, Inc.). Cyclooxygenase activity in the 10 absence of test compounds is determined as the difference in PGE2 levels of cells challenged with arachidonic acid versus the PGE2 levels in cells mock-challenged with ethanol vehicle. Inhibition of PGE2 synthesis by test compounds is calculated as a percentage of the activity in the presence of drug versus the activity in the positive control samples. 15

Assay of COX-1 Activity from U937 cell microsomes

U 937 cells are pelleted by centrifugation at 500 x g for 5
min and washed once with phosphate-buffered saline and repelleted.
Cells are resuspended in homogenization buffer consisting of 0.1 M Tris-HCl, pH 7.4, 10 mM EDTA, 2 μg/ml leupeptin, 2 μg/ml soybean trypsin inhibitor, 2 μg/ml aprotinin and 1 mM phenyl methyl sulfonyl fluoride.
The cell suspension is sonicated 4 times for 10 sec and is centrifuged at 10,000 x g for 10 min at 4° C. The supernatant is centrifuged at 100,000 x g for 1 hr at 4 ° C. The 100,000 x g microsomal pellet is resuspended in 0.1 M Tris-HCl, pH 7.4, 10 mM EDTA to approximately 7 mg protein/ml and stored at -80° C.

Microsomal preparations are thawed immediately prior to use, subjected to a brief sonication, and then diluted to a protein concentration of 125 μg/ml in 0.1 M Tris-HCl buffer, pH 7.4 containing 10 mM EDTA, 0.5 mM phenol, 1 mM reduced glutathione and 1 μM hematin. Assays are performed in duplicate in a final volume of 250 μl. Initially, 5 μl of DMSO vehicle or drug in DMSO are added to 20 μl of

- 126 -

0.1 M Tris-HCl buffer, pH 7.4 containing 10 mM EDTA in wells of a 96-deepwell polypropylene titre plate. 200 µl of the microsomal preparation are then added and pre-incubated for 15 min at room temperature before addition of 25 µl of 1 M arachidonic acid in 0.1 M Tris-HCl and 10 mM EDTA, pH 7.4. Samples are incubated for 40 min at room temperature and the reaction is stopped by the addition of 25 µl of 1 N HCl. Samples are neutralized with 25 µl of 1 N NaOH prior to quantitation of PGE₂ content by radioimmunoassay (Dupont-NEN or Amersham assay kits). Cyclooxygenase activity is defined as the difference between PGE₂ levels in samples incubated in the presence of arachidonic acid and ethanol vehicle.

Assay of the activity of purified human COX-2

5

10

The enzyme activity is measured using a chromogenic assay based on the oxidation of N,N,N',N'-tetramethyl-p-phenylenediamine (TMPD) during the reduction of PGG₂ to PGH₂ by COX-2 (Copeland et al. (1994) Proc. Natl. Acad. Sci. 91, 11202-11206).

Recombinant human COX-2 is purified from Sf9 cells as previously described (Percival et al (1994) Arch. Biochem. Biophys. 15, 111-118). The assay mixture (180 µL) contains 100 mM sodium 20 phosphate, pH 6.5, 2 mM genapol X-100, 1 µM hematin, 1 mg/ml gelatin , 80-100 units of purified enzyme (One unit of enzyme is defined as the amount of enzyme required to produce an O.D. change of 0.001/min at 610 nm) and 4 µL of the test compound in DMSO. The mixture is pre-25 incubated at room temperature (22°C) for 15 minutes prior to initiation of the enzymatic reaction by the addition of 20 µL of a sonicated solution of 1 mM arachidonic acid (AA) and 1 mM TMPD in assay buffer (without enzyme or hematin). The enzymatic activity is measured by estimation of the initial velocity of TMPD oxidation over the first 36 sec of the reaction. A non-specific rate of oxidation is observed in the absence of 30 enzyme (0.007 - 0.010 O.D. /min) and is subtracted before the calculation of the % inhibition. IC50 values are derived from 4-parameter least squares non-linear regression analysis of the log-dose vs % inhibition plot.

HUMAN WHOLE BLOOD ASSAY

Rationale

5

10

15

20

25

30

Human whole blood provides a protein and cell-rich milieu appropriate for the study of biochemical efficacy of anti-inflammatory compounds such as selective COX-2 inhibitors. Studies have shown that normal human blood does not contain the COX-2 enzyme. This is consistent with the observation that COX-2 inhibitors have no effect on PGE₂ production in normal blood. These inhibitors are active only after incubation of human whole blood with LPS, which induces COX-2. This assay can be used to evaluate the inhibitory effect of selective COX-2 inhibitors on PGE2 production. As well, platelets in whole blood contain a large amount of the COX-1 enzyme. Immediately following blood clotting, platelets are activated through a thrombin-mediated mechanism. This reaction results in the production of thromboxane B2 (TxB2) via activation of COX-1. Thus, the effect of test compounds on TxB2 levels following blood clotting can be examined and used as an index for COX-I activity. Therefore, the degree of selectivity by the test compound can be determined by measuring the levels of PGE2 after LPS induction (COX-2) and TxB2 following blood clotting (COX-1) in the same assay.

Method

A. COX-2 (LPS-induced PGE₂ production)

Fresh blood is collected in heparinized tubes by venipuncture from both male and female volunteers. The subjects have no apparent inflammatory conditions and have not taken any NSAIDs for at least 7 days prior to blood collection. Plasma is immediately obtained from a 2mL blood aliquot to use as blank (basal levels of PGE2). The remaining blood is incubated with LPS (100 µg/ml final concentration, Sigma Chem, #L-2630 from E. coli; diluted in 0.1% BSA (Phosphate buffered saline) for 5 minutes at room temperature. Five hundred µL aliquots of blood are incubated with either 2µL of vehicle (DMSO) or 2µL of a test compound at final concentrations varying from 10nM to

- 128 -

 $30\mu M$ for 24 hours at $37^{\circ}C$. At the end of the incubation, the blood is centrifuged at $12,000 \times g$ for 5 minutes to obtain plasma. A $100\mu L$ aliquot of plasma is mixed with $400\mu L$ of methanol for protein precipitation. The supernatant is obtained and is assayed for PGE2 using a radioimmunoassay kit (Amersham, RPA#530) after conversion of PGE2 to its methyl oximate derivative according to the manufacturer's procedure.

B. COX-1 (Clotting-induced TxB, production)

Fresh blood is collected into vacutainers containing no anticoagulants. Aliquots of $500\mu L$ are immediately transferred to siliconized microcentrifuge tubes preloaded with $2\mu L$ of either DMSO or a test compound at final concentrations varying from 10nM to $30\mu M$. The tubes are vortexed and incubated at $37^{\circ}C$ for 1 hour to allow blood to clot. At the end of incubation, serum is obtained by centrifugation (12,000 x g for 5 min.). A $100\mu L$ aliquot of serum is mixed with $400\mu L$ of methanol for protein precipitation. The supernatant is obtained and is assayed for TxB_2 using a enzyme immunoassay kit (Cayman, #519031) according to the manufacturer's instruction.

RAT PAW EDEMA ASSAY

Protocol

Male Sprague-Dawley rats (150-200 g) are fasted overnight and are given, po, either vehicle (1% methocel or 5% Tween 80) or a test compound. One hr later, a line is drawn using a permanent marker at the level above the ankle in one hind paw to define the area of the paw to be monitored. The paw volume (V0) is measured using a plethysmometer (Ugo-Basile, Italy) based on the principle of water displacement. The animals are then injected subplantarly with 50 µl of 1% carrageenan solution in saline (FMC Corp, Maine) into the paw using an insulin syringe with a 25-gauge needle (i.e. 500 µg carrageenan per paw). Three hr later, the paw volume (V3) is measured and the increases in paw

- 129 -

volume (V3 - V0) are calculated. The animals are sacrificed by CO2 asphyxiation and the absence or presence of stomach lesions scored. Data is compared with the vehicle-control values and percent inhibition calculated. All treatment groups are coded to eliminate observer bias.

5

NSAID-INDUCED GASTROPATHY IN RATS

Rationale

The major side effect of conventional NSAIDs is their ability to produce gastric lesions in man. This action is believed to be caused by inhibition of Cox-1 in the gastrointestinal tract. Rats are particularly sensitive to the actions of NSAIDs. In fact, rat models have been used commonly in the past to evaluate the gastrointestinal side effects of current conventional NSAIDs. In the present assay, NSAID-induced gastrointestinal damage is observed by measuring fecal 51Cr excretion after systemic injection of 51Cr-labeled red blood cells. Fecal 51Cr excretion is a well-established and sensitive technique to detect gastrointestinal integrity in animals and man.

20 Methods

25

30

Male Sprague Dawley rats (150 - 200 g) are administered orally a test compound either once (acute dosing) or b.i.d. for 5 days (chronic dosing). Immediately after the administration of the last dose, the rats are injected via a tail vein with 0.5 mL of 51Cr-labeled red blood cells from a donor rat. The animals are placed individually in metabolism cages with food and water ad lib. Feces are collected for a 48 h period and 51Cr fecal excretion is calculated as a percent of total injected dose. 51Cr-labeled red blood cells are prepared using the following procedures. Ten mL of blood is collected in heparinized tubes via the vena cava from a donor rat. Plasma is removed by centrifugation and replenished with equal volume of HBSS. The red blood cells are incubated with 400 Ci of sodium 51chromate for 30 min. at 37C. At the end of the incubation, the red blood cells are washed twice with 20 mL HBSS to remove free

- 130 -

sodium ⁵¹chromate. The red blood cells are finally reconstituted in 10 mL HBSS and 0.5 mL of the solution (about 20 Ci) is injected per rat.

PROTEIN-LOSING GASTROPATHY IN SQUIRREL MONKEYS

5

10

15

Rationale

Protein-losing gastropathy (manifested as appearance of circulating cells and plasma proteins in the GI tract) is a significant and dose-limiting adverse response to standard non-steroidal anti-inflammatory drugs (NSAIDs). This can be quantitatively assessed by intravenous administration of 51CrCl3 solution. This isotopic ion can avidly bind to cell and serum globins and cell endoplasmic reticulum. Measurement of radioactivity appearing in feces collected for 24 h after administration of the isotope thus provides a sensitive and quantitative index of protein-losing gastropathy.

Methods

Groups of male squirrel monkeys (0.8 to 1.4 kg) are treated by gavage with either 1% methocell or 5% Tween 80 in H20 vehicles,

(3mL/kg b.i.d.) or test compounds at doses from 1 - 100 mg/kg b.i.d. for 5 days. Intravenous 51Cr (5Ci/kg in 1 ml/kg phosphate buffer saline (PBS)) is administered 1 h after the last drug/vehicle dose, and feces collected for 24 h in a metabolism cage and assessed for excreted 51Cr by gamma-counting. Venous blood is sampled 1 h and 8 h after the last drug dose, and plasma concentrations of drug measured by RP-HPLC.

Representative Biological Data

Compounds of the present invention are inhibitors of cyclooxygenase-2 and are thereby useful in the treatment of cyclooxygenase-2 mediated diseases as enumerated above. The activities of the compounds against cyclooxygenase may be seen in the representative results shown below. In the assay, inhibition is determined by measuring the amount of prostaglandin E2 (PGE2) synthesized in the

- 131 -

presence of arachidonic acid, cyclooxygenase-1 or cyclooxygenase-2 and a putative inhibitor. The IC50 values represent the concentration of putative inhibitor

5 required to return PGE2 synthesis to 50% of that obtained as compared to the uninhibited control.

The results for certain of the biological assays may be seen in Tables II, III and IV.

The invention will now be illustrated by the following nonlimiting examples in which, unless stated otherwise:

(i) all operations were carried out at room or ambient temperature, that is, at a temperature in the range 18-25°C;
(ii) evaporation of solvent was carried out using a rotary evaporator under reduced pressure (600-4000 pascals: 4.5-

30 mm Hg) with a bath temperature of up to 60°C; (iii) the course of reactions was followed by thin layer chromatography (TLC) and reaction times are given for illustration only;

(iv) melting points are uncorrected and 'd' indicates decomposition; the melting points given are those obtained for the materials prepared as described; polymorphism may result in isolation of materials with different melting points in some preparations;

(v) the structure and purity of all final products were assured by at least one of the following techniques: TLC, mass spectrometry, nuclear magnetic resonance (NMR) spectrometry or microanalytical data;

(vi) yields are given for illustration only;

EXAMPLE 1

3-(3,4-Difluorophenoxy)-5,5-dimethyl-4-(4-(methylsulfonyl)phenyl)-5H-furan-2-one

Step 1: 2-Methyl-1-(4-(methylthio)phenyl)-propan-1-one
To a suspension of aluminum chloride (136 g, 1.02 mol) in chloroform (1.0 L) cooled to -10 °C, was added dropwise

10 isobutyrylchloride (115 mL, 1.10 mol). Then thioanisole (100 mL, 0.85 mol) was added dropwise. Upon completion of addition the reaction was allowed to proceed at r.t. for 1.5h. The reaction was cooled to 10 °C and quenched by addition of water (750 mL). The organic layer was separated, washed with water (2 x 500 mL), saturated NaHCO3

15 solution(2 x 500 mL), brine (1 x 500 mL), and then dried over Na2SO4. After concentration in vacuo., the resulting crude product crystallized upon standing under high vacuum for 30 min to give the title compound as a brown solid.

Step 2: 2-Hydroxy-2-methyl-1-(4-(methylthio)phenyl)propan-1-one
 To a solution of 2-methyl-1-(4-(methylthio)phenyl)propan1-one (28.5 g, 147 mmol, Step 1), Aliquat 336 (11.0 mL, 24 mmol) and
carbon tetrachloride (21 mL, 218 mmol) in toluene (43 mL) was added
sodium hydroxide (12.9 g, pellets, 322 mmol). The reaction was stirred
at 15 °C for 2h and then at r.t. for 16h. The reaction was diluted with
water (100 mL), brine (100 mL) and EtOAc (300 mL). The aqueous
phase was acidified with 1 N HCl and extracted with EtOAc (100 mL).
The combined organic layers were dried over Na2SO4 and concentrated.
The crude product was purified by silica gel chromatography eluted with
15% EtOAc in hexane to give the title compound as a thick syrup.

Step 3: 2-Hydroxy-2-methyl-1-(4-(methylsulfonyl)phenyl)propan-1-one

- 139 -

To a cold (4 °C) solution of 2-hydroxy-2-methyl-1-(4(methylthio)phenyl)propan-1-one (45.0 g, 214 mmol, Step 2) in t-butanol
(500 mL) and CH2Cl2 (500 mL) was added a solution of OXONETM
(194 g, 316 mmol) in water (1.4 L). The resulting suspension was stirred
at r.t. for 18h. The reaction was diluted with EtOAc (400 mL) and the
layers were separated. The aqueous layer was extracted with EtOAc (2 x
250 mL). The combined organic layers were dried over Na2SO4 and
concentrated in vacuo. The crude product was dissolved in diethyl ether
(250 mL), hexane was added (150 mL) and the product was swished for
2h. The product was collected by filtration to give the title compound as
a yellow solid.

Step 4: 3-(3,4-Difluorophenoxy)-5,5-dimethyl-4-(4-(methylsulfonyl) phenyl)-5H-furan-2-one

A solution of 3,4-difluorophenoxyacetic acid (0.51g, 2.73 mmol), 2-hydroxy-2-methyl-1-(4-(methylsulfonyl)phenyl)propan-1-one (0.5g, 2.1mmol, Step 3), CMC (1.13g, 2.73mmol) and DMAP (15 mg, 0.10mmol) in dichloromethane (12ml) was stirred at r.t. for 18 hrs. Then, DBU (0.63ml, 4.2mmol) was added and the reaction mixture was refluxed for 3 h. After cooling to r.t.the mixture was extracted with ethyl acetate and washed successively with water, 1N HCl and brine. The organic layer was dried over MgSO4, filtered and the solvent evaporated under vacuum. The residue was triturated in a mixture of ethyl acetate and hexane affording the title compound as a solid. M.P.: 93-95 °C.

To a solution of the compound obtained in the previous step (2.0g, 5.1mmol) in dichloromethane (100mL) at r.t. was added mCPBA (4.0g, Aldrich 57-86%, ~16mmol). The mixture was stirred at r.t. for 3h and more mCPBA (2.0g) was added. After stirring for another hour the mixture was washed with 1N NaOH, brine, dried and concentrated under vacuum to yield a disulfone as a white foam (2.0g). To a solution of 3,4-difluorophenol (2.0g, 14.9mmol) in DMF was added 10N NaOH (1mL, 10mmol). After 30min. a solution of the above disulfone (2.0g, 4.7mmol) in DMF was added. The mixture was heated at 80-85°C for 1.5h. After cooling the mixture was diluted with water, extracted with EtOAc, the organic extracts were washed with 1N NaOH, 1N HCl, brine, dried over MgSO4, filtered and the solvent evaporated under vacuum. Purification by silica gel chromatography afforded the title compound as a white solid (600mg).

5 Step 1: 1-(4-(Methylthio)phenyl)-5-phenoxypenta-1,4-dione
To a mixture containing 1-phenoxybut-3-en-2-one (1.0g)
(A.G. Schultz, R.D. Lucci, W.Y. Fu, M.H. Berger, J. Erhardt and W.K. Hagmann, J. Amer. Chem. Soc. 100, 2150, (1978)), 4(methylthio)benzaldehyde (0.62g) and triethylamine (0.343mL) in 1,4dioxane (20 mL) was added 3-benzyl-5-(2-hydroxyethyl)-4methylthiazolium chloride (110mg). After stirring 4h. at 100°C the reaction mixture was extracted with EtOAc, dried over MgSO4, filtered and the solvent evaporated under vacuum. The residue was purified by silica gel chromatography (20% EtOAc/Hexane) to afford 140mg of the title compound as an oil.

Step 2: 3-(4-(Methylthio)phenyl)-2-phenoxycyclopent-2-enone
To the diketone of Step 1 (120mg) in methanol (80mL) was added DBU (0.1mL). The resulting mixture was heated at 60°C for 18 h.

The methanol was then evaporated and to the crude mixture was added saturated aqueous ammonium chloride, the mixture was then extracted with EtOAc, the organic layer was dried over MgSO4, filtered, and the solvent evaporated under vacuum. The residue was purified by silica gel chromatography (20% EtOAc/hexane) to afford the title compound.

EXAMPLE 111

5.5-Dimethyl-4-(4-(methylsulfonyl)phenyl)-3-(piperidine-1-carbonyl)-5-H-furan-2-one.

Step 1 5.5-Dimethyl-4-(4-(methylsulfonyl)phenyl)-2-oxo-2.5-dihydrofuran-3-carboxylic acid ethyl ester

A mixture of 2-hydroxy-2-methyl-1-(4-

- 25 (methylsulfonyl) phenyl)propan-1-one (2.87 g, 11.8 mmol), ethyl hydrogen malonate (2.02 g, 15.3 mmol), CMC (6.51 g, 15.4 mmol) and DMAP (0.35 g, 2.8 mmol) was dissolved in 100 mL of CH₂Cl₂. The mixture was stirred for 14h at room temperature, then DBU (4 mL, 27 mmol) was added, stirred 1h, then partitioned between CH₂Cl₂ and 1M
- HCl. The organic layer was washed with brine, filtered through cotton and evaporated. Purification by flash chromatography (90% ether/Hex) provided 2.50 g of the title compound.

¹H NMR (CD₃COCD₃) δ 8.09 (2H, m), 7.68 (2H, m), 4.05 (2H, q), 3.16 (3H, s), 1.58 (6H, s), 0.96 (3H, t).

Step 2 5.5-Dimethyl-4-(4-(methylsulfonyl)phenyl)-3-(piperidine-1-carbonyl)-5H-furan-2-one

- 169 -

To a room temperature solution of piperidine (284 mg, 3.33 mmol) in CH₂Cl₂ (5mL) was added trimethylaluminum (2M in hexane, 1.7 mL, 3.4 mmol). After 15 min, the product from Step 1 (310 mg, 0.92 mmol) was added in one portion and the mixture was heated to reflux for 20h. The resulting solution was cooled and poured into 1M HCl (gas evolution). The organic layer was washed with brine, filtered through cotton and evaporated. Purification by flash chromatography (80% EtOAc/Hex) provided 175 mg of the title compound. ¹H NMR (CD₃COCD₃) δ 8.08 (2H, m), 7.80 (2H, m), 3.49 (2H, m), 3.35 (2H, m), 3.17 (3H, s), 1.65 (6H, s), 1.55 (2H, m), 1.40 (4H, m).

- 5 Step 1 Pentyl-3-oxyacetic acid
 - To a solution of 3-pentanol (17.6 g, 200 mmol) in benzene (200 mL) was added NaH (6.0 g, 400 mmol). After 1h at r.t., chloroacetic acid sodium salt (25.6 g, 200 mmol) was added to the previous mixture. After a period of 2hr. at reflux, the reaction mixture was pourred in H₂O and acidified with HCl. The mixture was extracted with CH₂Cl₂, dried over MgSO₄, filtered over silicic acid (30% EOAc in Hexane). After evaporation of the solvents the title compound was purified by distillation (5.0 g).
- 15 Step 2 Pentyl-3-oxyacetic acid 2-methyl-1-(4-methylsulfonyl phenyl)propan-1-one-yl ester

 The title compound was obtained using similar protocol as described for Example 1 Step 3.
- 20 Step 3 5.5-Dimethyl-4-(4-methylsulfonylphenyl)-3-(3-pentylxy)-5H-furan-2-one.

To a solution of the ester of Step 2 (500 mg, 1.35 mmol) in DMF (2.5 mL) was added NaH (50 mg, 1.6 mmol). The reaction mixture was heated gently to give an orange mixture. After standard extractive workup procedure (EtOAc), the crude mixture was purified by flash chromatography (35% EtOAc in hexane to afford 115 mg of the title compound by filtration in Et₂O/hexane.

(5R)-3-(5-Chloro-2-pyridyloxy)-5-methyl-4-(4-methylsulfonyl)phenyl-5-(2.2.2-trifluoroethyl)-5H-furan-2-one

Step 1: 2-(S)-t-butyl-5-(R)-methyl-5-(2,2,2-trifluoroethyl)-1,3-dioxolan-4-one

To a solution of lithium diisopropylamide (prepared from 13 ml of diisopropylamine and 54 ml of 1.6 M n-BuLi in hexanes in 200 ml of anhydrous THF at 0°C) at -72°C was added slowly 2-(s)-t-butyl-5-(s)-methyl-1,3-dioxolan-4-one (12.95 g, 81.9 mmol, *Tetrahedron*, 1984, 40, 1313) at such a rate as to maintain the internal temperature below -60°C and the mixture was aged at -72°C for an hour. 1,1,1-Trifluoro-2-

iodoethane (25 g, 119 mmol) was added quickly, the reaction temperature increased to -45°C and the mixture was aged at -72°C for 45 min. and then allowed to warm up to -20°C over 20 min. Saturated aq. NH4Cl was then added and the product was extracted in i-PrOAc, dried over Na2SO4, concentrated and distilled under reduced pressure to afford 7.51 g of a brown oil BP 90°C / 20 mm Hg.

5 EXAMPLE 134

3-(1-Cyclopropyl-ethoxy)-5,5-dimethyl-4-(4-methyl sulfonyl)phenyl)-5H-furan-2-one

10 Step 1: (1-cyclopropyl-ethoxy)acetic acid

To a suspension of NaH (80% in oil) (15.7 g, 523 mmol) in THF (180 mL) at 0°C were added bromoacetic acid (28.0 g, 203 mmol) and a-methylcyclopropane methanol (10.0 g, 116 mmol). The resulting mixture was then stirred at 70°C. After a period of 18 h, the reaction mixture was poured over cold H2O and the H2O phase was extracted once with Et2O. The water phase was acidified with HCl and extracted twice with Et2O. The ether was dried over MgSO4, filtered and evaporated under reduced pressure. The crude oil was then purified by flash chromotography (40% EtOAc in hexane to 40% EtOAc in Hexane + AcOH) to provide 5.0 g of the title compound.

Step 2: 2-(1-Cyclopropylethoxy)acetic acid 2-methyl-1-(4-methylsulfonyl)phenyl)propan-1-one-2-yl ester

A mixture of (1-cyclopropyl-ethoxy) acetic acid (1.0 g, 6.90 mmol; Example 134, Step 1) 2-hydroxy-2-methyl-1-(4-(methylsulfonyl)phenyl) propan-1-one (1.37 g, 5.76 mmol; Example 1, Step 3), CMC (8.90 g, 20.8 mmol) and DMAP (100 mg, 0.820 mmol) in CH2Cl2 (100 ml) was left at r.t. for a period of 18h. The resulting mixture was partitioned between NH4OAc (20%) and CH2Cl2. The organic phase was dried over MgSO4, filtered and evaporated under reduced pressure. The resulting mixture was purified by flash chromatography (35% EtOAc in hexane) to provide 590 mg of the title compound.

109, Step 1) in DMF (6 mL) were added NaH (65 mg, 1.2 eq.), and
neopentyl iodide (585 μL). After a period of 18 h at 70 °C, the reaction
mixture was diluted with EtOAc. The mixture was washed with H₂O and
the organic phase separated, dried over MgSO4 and evaporated under
reduced pressure. The resulting oil was purified by flash chromatography
to provide the title compound (124 mg) as a white solid after
precipitation with Et₂O.

- 5(S) 5-Ethyl-5-methyl-4-(4-(methylsulfonyl)phenyl-3-(2-propoxy)-5Hfuran-2-one
- Step 1: (±) 2-Methyl-1-(4-methylsulfonylphenyl)-prop-2-en-1-ol
 To a solution of 4-bromothioanisole (51 g) in THF (600 mL)

 15 cooled to -72°C was added dropwise a solution of n-BuLi (120 mL, 2.4
 M in hexane) over a period of 30 min. The mixture was stirred at -78°C
 for 2 h and then a solution of methacrolein (20.3 g) in THF (50 mL) was
 added over a period of 5 min. The reaction mixture was warmed to -20°C
 over a period of 20 min. and then quenched with saturated NH4Cl (200

 20 mL) and H2O (200 mL). The product was extracted with 500 mL of 1:1
 hexane/EtOAc, and dried over MgSO4. The extract was filtered and
 concentrated to give the title compound as a yellow oil (55 g).
- Step 2: (±) 2-Methyl-1-(4-methylsulfonylphenyl)-prop-2-en-1-ol
 To a solution of the product from Step 1 (55 g., crude) in
 MeOH (1L) cooled to 0°C was added a solution of Oxone® (190 g in 700 mL H2O) over a period of 2 h. The mixture was stirred at 5°C for an additional 3 h and then filtered. The filtrate was concentrated to remove
 MeOH and the remaining aqueous mixture was extracted with 1L of 2:1

 EtOAc/hexane. The extract was dried over MgSO4 filtered and concentrated. The residue was purified by silica gel chromatography eluted with 3:2 hexane/EtOAc to give the title compound (22 g) as a colorless oil.

30

Step 3: (S)-2-Methyl-1-(4-methylsulfonylphenyl)-prop-2-en-1-ol To a solution of dry 4A molecular sieves (20 g), and Ti (O2Pr)4 (24.8 mL) in CH2Cl2 (1L) cooled to -25°C was added dropwise (+)-diisopropyltartrate (22.4 mL). After stirring at -25°C for 30 min., a solution of (±)-2-methyl-1-(4-methylsulfonylphenyl)-prop-2-en-1-ol (21 5 g) in 500 mL of CH2Cl2 was added dropwise, followed by a solution of t-butyl hydroperoxide (20 mL, 5M in decane). The reaction mixture was stirred at -25°C for 5 h and then quenched with 500 mL of 10% aqueous solution of tartaric acid. After stirring for 1 h, the CH2Cl2 layer was separated, dried over MgSO4 and concentrated. The residue was purified 10 by silica gel chromatography eluted first with 3:1 hexane/EtOAc followed by 1:2 hexane/EtOAc to give the title compound as a white solid (9 g).

15 <u>Step 4</u>: (R)-(2-Methyloxiran-2-yl)-(4-methanesulfonylphenyl)-methanol

Following the same procedure described in Step 3 using 15 g of 4A molecular sieves, 500 mL of CH₂Cl₂, 12.4 mL of Ti(OiPr)₄, 11.2 mL of (-)-diisopropyl tartrate, 20 mL of 5M tBuOOH in decane and 9.8 g of the product from Step 3, the title compound (7.6 g, white solid) was obtained.

Step 5: (R)-[(1-Ethoxy-ethoxy)-(4-methanesulfonylphenyl)-methyl]-2-methyloxirane

25 To a solution of the product from Step 4 (7.2 g) and ethylvinyl ether (50 mL) in 200 mL of CH₂Cl₂ cooled to 0°C was added 50 mg of camphorsulfonic acid. The reaction mixture was stirred at r.t. for 20 min. and then treated with 1 mL of Et₃N, concentrated to give the crude title compound (9g).

Step 6: (R,S)-1-(1-Ethoxy-ethoxy)-2-methyl-1-(4-methylsulfonylphenyl)-butan-2-ol

To a suspension of CuI(20 g) in EtO (450 mL) cooled at -40°C was added dropwise a solution of MeLi (150 mL, 1.4 M in Et₂O).

After stirring at -40°C for 20 min., a solution of the crude product from Step 7 (9 g) in 50 mL of Et₂O was added. The reaction mixture was stirred at -40°C for 30 min. and then quenched with 20 mL of MeOH and 300 mL of saturated NH₄Cl solution. Air was bubbled into the mixture with stirring at r.t. for 1 h. The resulting mixture was then extracted with 400 mL of Et₂O and the Et₂O extract was dried over MgSO₄ and concentrated to give the crude title compound (10 g) which was used for next step without further purification.

10 Step 7: (R.S)-2-Methyl-1-(4-methylsulfonylphenyl)-butane-1,2-diol A solution of the crude product from Step 8 (10 g) in 200 mL of THF, 50 mL of AcOH and 50 mL of H₂O was heated at 50°C for 15 h. The mixture was then concentrated to give the crude title compound (7 g) which was used for next step with further purification.

15 <u>Step 8</u>:

5

(S)-2-Hydroxy-2-methyl-1-(4-methylsulfonylphenyl)-butan-1-one

To a solution of the crude product from Step 7 (7 g) and (Bu3Sn)2O (30 mL) in 150 mL of CH2Cl2 cooled at 10°C was added a solution of Br2 (9.3 g in 30 mL of CH2Cl2). After stirring at r.t. for 30 min. the mixture was diluted with a solution of KF (500 mL, 3N) and 500 mL of Et2O. The solid generated was removed by filtration and the filtrate was separated. The organic layer was dried over MgSO4 and concentrated. The residue was purified by silica gel chromatography eluted with 1:1 hexane/EtOAc to give 5 g of the title compound as a yellow oil.

- 5-Cyclopropylmethyl-3-(3,4-difluorophenoxy)-5-methyl--(4-methylsulfonyl)phenyl-5H-furan-2-one
 - Step 1: 2-Cyclopropylmethyl-2-methyl-1-(4-thiomethyl)phenyl-propan-1-one
- To a cold (-78 °C) solution of 1-(4-thiomethyl)phenyl-propan-1-one (900 mg, 5 mmol) in dry THF (15 mL) was added a solution of KHMDS (5.5 mmol, 11 mL). The mixture was warmed to r.t. for 5 min and then cooled to 0 °C. Bromomethylcyclopropane (810 mg, 6 mmol) was added. The mixture was warmed to r.t. and stirred for 20 h.
- Aqueous NH4Cl solution was added. The mixture was extracted with EtOAc and the concentrated crude extract was purified by chromatography on silica gel (eluted with 20% EtOAc/hexane) to give 435 mg (37%) of the title compound.
- 30 <u>Step 2</u>: 2-Cyclopropylmethyl-2-methyl-1-(4-methylsulfonyl)phenyl-propan-1-one

To a solution of the product of step 1 (435 mg, 1.87 mmol) in a mixture of CH2ClCH2Cl (10 mL) and methanol (10 mL) was added MMPP (2.3 g 3.7 mmol) in 2 portions. The mixture was stirred at r.t. for

6 h. H₂O was added and the product was extracted with EtOAc. The extracts were washed with H₂O and brine, dried and concentrated to an oil. The crude oil was purified by chromatography on silica gel (eluted with 30% EtOAc/hexane) to give 363 mg (83%) of the title compound.

- 29. A compound according to Claim 1 which is 5,5-Dimethyl-4-(4-methylsulfonylphenyl)-3-(2-propoxy)-5H-furan-2-one, or a pharmaceutically acceptable salt thereof.
- 30. A pharmaceutical composition for treating an inflammatory disease susceptable to treatment with an non-steroidal anti-inflammatory agent comprising:
 a non-toxic therapeutically effective amount of a compound according to Claim 29 and a pharmaceutically acceptable carrier.
- 31. A method of treating an inflammatory disease
 susceptable to treatment with an non-steroidal anti-inflammatory agent comprising:
 administration to a patient in need of such treatment of a non-toxic therapeutically effective amount of a compound according to Claim 29 and a pharmaceutically acceptable carrier.

- 32. A compound according to Claim 1 selected from the group consisting of:
- (1) 2-(3,4-difluorophenoxy)-3-(4-methylsulfonylphenyl)-cyclopent-2-5 enone,
 - (2) 3-(5-Benzothiophenyloxy)-5,5-dimethyl-4-(4-(methylsulfonyl) phenyl)-5H-furan-2-one,
